Weight: 610g/21.5oz(Reg)

Incredibly warm yet light and packable down air mat for ultralight missions in hostile landscapes, from winter alpine climbing to Arctic ultra running. Powered by 800FP down and ultralight 20D fabric, it offers exceptional warm for its weight.

FEATURES

- Embossed 20D recycled polyester with 5.5S TPU coating (LW glue)
- 20D recycled polyester with 5.5S TPU coating (LW glue)
- 800FP European Goose Down with Nikwax Fluorocarbon-Free Hydrophobic Finish (190g /6.7oz)
- R-Value: 7.3
- Thickness: 8cm
- Oversized outer chambers help keep you centralised on the mat
- Lightweight construction uses air and insulation for superb warmth-to-weight ratio and minimal pack-size
- Hybrid rectangular shape allows various comfortable sleeping positions
- Low profile two-way valve for easy inflation and deflation

Ultrasphere 1.5

QMA-07

Unisex
DPW

Weight: 350g/12.3oz

Combining ultralight fabric and heat-trapping offset air chamber construction, our lightest mat offers maximum packability for when every gram counts. Highly comfortable, it's the ideal foundation for summer thru-hiking and multi-day mountain runs.

FEATURES

- 20D Recycled Polyester outer fabric with internal TPU Coating and fluorocarbon free DWR
- Offset weight saving internal cut outs help disrupt the flow of convection currents and keep warm air static
- R-Value: 1.3
- Thickness: 8cm
- Packed size: 18x9cm
- Tapered mummy shape to save weight
- Low profile two-way valve for easy inflation and deflation
- Pump sack included for rapid and hygienic inflation
- Roll-away stuff sack with repair kit included

Carry systems

V-TRAX™

The V-TRAX™ carry system features a simple hook-and-loop adjustable back panel so you can easily fine-tune the length. A sturdy, comfortable harness and supportive wraparound hip belt ensure full contact with your back and hips for superb stability.

Packs: Exion / Hyperon

X-SHIELD™

Built to offer complete mobility on vertical ascents, the X-SHIELD™ back system sits close to the body with a form fitting, pre curved back panel, which is also snow shedding. It has lightweight and low bulk construction with additional strap padding only where it's needed.

Packs: Latok / Khroma

TRI-FLEX™

Supportive and stable the TRI-FLEX™ carry system fits close to your back to enable complete freedom of movement and agility when carrying heavy loads. It's lightweight and strippable.

Packs: Muon / Outcast / Rogue

Air Contour™

A lightweight, close-fitting back system with a spacer mesh and cut out air channels offering ventilation over high heat areas. With pre curved back panel and flexibility, it moves with you over all terrain.

Packs: Protium / Nitron / Tensor

Carry systems

Suggested load range

Use this suggested range as a guide when loading our packs. The maximum weight that can be comfortably carried will vary according to the user's personal preference.

5 - 30 L

0 - 16 kg

30 - 50 L

7 - 19 kg

50 - 80 L

12 - 28 kg

Pack litre capacity

We use the ASTM standard F2153 Standard Test Method for Measurement of Backpack Capacity when we need to volume test our packs.

Using this standard helps us compare volumes within our range and also other manufacturers using the same standard.

The test uses 20mm plastic balls that are non-compressible and have a known volume. We then fill the pack with the balls until it's completely full in order to measure the volume. This involves filling all main body compartments and any other zipped compartments until fully packed.

The contents are then poured out into a tub with a scale on the inside. The balls are tamped down to be able to measure the height more precisely, which is then converted into the final volume of the pack.

Sizing and fitting

ND: Narrow dimensions

You may have noticed some of our packs have the letters ND in the name.

Our Narrow Dimensions (ND) packs are built with different proportions to our regular packs, making them ideally suited to anyone with a smaller frame. They're designed to provide a comfortable and supportive fit for women or men with a narrower build.

Vest style packs

These packs are available in small, medium, and large. As they're built without a fixed back system and come in a wide range of sizes, an ND option is not required.

Fixed back systems

We offer an ND version for most of our packs that use a fixed back system. However, due to the smaller volume of these packs, we must reduce the pack capacity to produce a Narrow Dimensions version with the same design proportions.

50L+

When we create packs with higher volumes, we can tweak the back system without having as much of an impact on the design of the pack. This means that for packs over 50L, our ND and regular packs have the same capacity.

Fabrics

ROBIC®

Fabrics and materials built with ROBIC® nylon 6 are up to 50% stronger with up to 2.5x the tear strength compared to standard nylon 6 fabrics.

Ballistic nylon

Created by DuPont during World War II, ballistic nylon refers to a very specific type of nylon fabric that has been engineered for improved abrasion resistance and maximum durability. A “ballistic weave” is a particularly tight and dense basket weave that maximises the fabric’s tear resistance in all directions. The constructional use of large denier individual nylon threads also effectively resists continued abrasion.

Dobby

A dobby is a type of fabric that has a specific texture created by the weaving two yarns. These fabrics can have a feeling of roughness and grain next to their plain weave counterparts and also give more visual interest

Ripstop

Ripstop fabrics are constructed using stronger and sometimes thicker yarns interwoven at regular intervals in a ripstop pattern. This reinforcing technique makes them more resistant to tearing and ripping. The stronger or thicker yarns help prevent holes forming into larger tears by stopping the ripping process at the nearest reinforced cross section.

Fabric	Style	Description
210D ROBIC® Nylon with Spectra® Ripstop	Hyperon, Latok	A 210D high tenacity nylon yarn woven with 200D Spectra® ripstop, which is a high tenacity UHMWPE (ultra high molecular weight polyethylene) yarn. This makes the fabric incredibly strong while saving on weight, and it's also 92% recycled.
330D Nylon Stripe Dobby	Exion, AirZone Trail	A 210D x 420D nylon that creates the interesting weave pattern by crossing 2 different yarns. This fabric is also 50% recycled.
100D ROBIC® Nylon Ripstop	Protium, Nitron	A 100D high tenacity nylon with a contrast horizontal yarn for an eye-catching look. The high tenacity yarns and low denier create a strong but lightweight fabric that is 36% recycled.
100D Nylon with Spectra® Ripstop	Muon	A 100D nylon woven with 200D Spectra® ripstop, which is a high tenacity UHMWPE (ultra high molecular weight polyethylene) yarn. This creates an ultra-lightweight fabric with an extremely strong ripstop that is also 85% recycled.
40D ROBIC® Siliconised Nylon Ripstop	Veil XP	A 40D ultra-lightweight high tenacity ripstop nylon with a siliconised treatment applied to the face fabric providing water resistance, even before additional coatings are applied. This fabric is also 80% recycled.
100D Regen™ Ocean ROBIC® Ripstop Nylon	AirZone Ultra	A 100D high tenacity nylon ripstop which is made from recycled fishing nets. The high tenacity yarns and low denier create a strong but lightweight fabric that is 100% recycled.
1680D Ballistic Polyester	Depot	A 1680D polyester which uses the heavy weight yarns in a double basket weave to create a stiff, strong and abrasion resistant fabric that is also 50% recycled.
Mono Mesh (104gsm)	Veil, Veil XP	A ripstop made from mono-filaments which are extruded, not spun like traditional yarn. This creates a fabric that is both strong and very breathable, with low weight and water absorption.
840D Ballistic Nylon	Rogue, Outcast	An 840D nylon which uses the heavyweight yarns in a double basket weave to create a stiff, strong and abrasion resistant fabric.

Fabric coatings

Hydroshield

Hydroshield is our standard PU coating that is applied to the reverse of our pack fabrics. As a minimum we insist that all our outer fabrics are coated with Hydroshield. It has a hydrostatic head of 1500mm meaning fabrics that use this coating could officially be classed as waterproof, however the packs themselves do not have taped seams unless stated. We also apply an additional fluorocarbon-free DWR to the face fabric.

TEAR RESISTANCE	■	■	■	■
WATER RESISTANCE	■	■	■	■
ABRASION RESISTANCE	■	■	■	■

Tri-Shield®

TriShield® is our high-performance tear resistant fabric coating that can be applied to the reverse of our pack fabrics. It's made from a mixture of PU and silicone which greatly improves the tear strength of our pack materials ensuring durability.

TriShield® can either be used as a stand-alone coating with a fluorocarbon-free DWR on the face fabric or in conjunction with Hydroshield Dura for optimal tear and abrasion resistance.

TEAR RESISTANCE	■	■	■	■
WATER RESISTANCE	■	■	■	■
ABRASION RESISTANCE	■	■	■	■

Hydroshield Dura

Hydroshield Dura is our premium fabric coating that works to increase both water and abrasion resistance. Here we apply a coating of either PU to both the reverse and face of the pack or TPU to the face and PU to the reverse.

TEAR RESISTANCE	■	■	■	■
WATER RESISTANCE	■	■	■	■
ABRASION RESISTANCE	■	■	■	■

We must be clear about how we communicate CSR information relating to our brands and products. This ensures a consistent message and that we comply with the latest guidance and legislation. Be specific. Be clear. Be accurate.

MATERIAL FACTS PRODUCT CLAIMS

When referring to product sustainability data always refer to current Material Facts tables.

Avoid these words: "eco", "eco-friendly", "green", "environmentally friendly", "ethical", "sustainable".

FAIR WEAR FOUNDATION

When speaking about Fair Wear:

We are a "member of Fair Wear Foundation" and are committed to improving working conditions for garment workers.

Use the full "Fair Wear Foundation" name on the first mention, and then shorten to "Fair Wear".

Use the 'Rab and Lowe Alpine are members of' logo when discussing products or our membership.

Don't describe the product as "fair", "ethical", or "responsibly made". It is not Fair Trade.

Fair Wear do not certify, audit, or approve us. Avoid these terms.

Recommended wording: "Rab and Lowe Alpine awarded "Leader" status by Fair Wear for the second year running in 2023."

RESPONSIBLE DOWN STANDARD

When writing about Responsible Down Standard use the full name in the first mention, then the abbreviation RDS. When making a product RDS claim, you must:

State "This product / component is RDS certified by Control Union 839597."

Include the RDS logo with the licence number.

Any mention of species or quality must be made in its own sentence in isolation, and not refer to RDS e.g. "This jacket uses 800FP goose down."

Link to <https://textileexchange.org/standards/responsible-down/>

Describe RDS as "The [Responsible Down Standard / RDS] independently certifies down against animal welfare requirements and tracks it from the source to the final product."

Never describe RDS certified down as "ethical", "kind" or "animal friendly".

CLIMATE ACTION / RACE TO ZERO

We no longer describe Equip, Rab or Lowe Alpine as a "Climate Neutral Company". We are phasing out this older language and removing our South Pole Climate Neutral label for SS25.

When describing our efforts we are no longer "aiming for Net Zero emissions by 2030".

Instead, we have committed to Science Based Targets (SBT) with near-term and long-term targets.

"Equip / Rab / Lowe Alpine commits to reduce absolute scope 1 and scope 2 GHG emissions 46% by 2030 from a 2019 base year, and to measure and reduce its scope 3 emissions."

"Equip / Rab / Lowe Alpine commits to reduce absolute scope 1, 2, and 3 GHG emissions 90% by 2050 from a 2019 base year."

For any queries, questions, concerns, amends or confusion please contact:

1. FABRIC AND MATERIAL DATA

1.1	Why does Rab still use fluorocarbons (PFAS)?	We have removed all long-chain (C8) fluorocarbons (PFCs) from our supply chain. However, some short-chain (C6) fluorocarbons (PFCs) are still needed for some of our high-end technical products. We are working with our partners to eliminate fluorocarbons from all our ranges by AW24.
1.2	How do all these changes to fabrics and materials affect the durability and longevity of your products?	At Rab, product performance is at the core of everything we do. We are a highly technical brand, providing products for some of the most extreme environments in the world. We will never compromise on that. We replace fabrics and materials with recycled and fluorocarbon-free alternatives wherever available and possible if performance is not sacrificed. Through our Rab Lab programme, we are educating end consumers on how to treat their outdoor kit to maximise its performance and longevity.
1.3	What's a trim?	A trim is an item added to apparel or equipment which enhances it, adds technical features, or increases brand presence. Trims include (but are not limited to) zips, toggles, pulls, pocket linings, logos, hood stiffeners, cords, and eyelets.
1.4	Which weights of garments are you using?	Men's: Calculations based upon the weight of a men's size medium. Women's: Calculations based upon the weight of a women's size 10. Unisex Apparel: Calculations based upon the weight of a size medium. Sleeping Bags: Calculations based on the weight of a regular-length sleeping bag. Sleeping Bag Liners/Accessories: Based on actual product weight
1.5	Why does the Material Facts table show 1% recycled trims and yet the overall product content is showing 0% recycled?	Our data is accurate. Rounding rules mean that we would have to show % to a number of decimal places. For simplicity we have rounded up, hence sometimes a small percentage of recycled content in a trim will not show against the overall garment's % recycled materials.
1.6	Why is there sometimes variation in women's and men's recycled content?	Size and cut variations between men's and women's designs may result in the trims (i.e. zips, toggles, pullers) being a greater or lesser % of the overall product weight. This could reflect in small percentage changes in recycled content.
1.7	Why do zips and trims contain fluorocarbons?	Fluorocarbons are commonly used in the manufacturing process for many moulded items such as toggles and zips, as a release agent from moulds. Some zips have PTFE, a legally compliant fluorocarbon, in the enamel paint used on sliders and some pin boxes. Trace fluorocarbons may remain on the trim. Shell jackets include trims such as seam tapes and pocket liners that may contain ePTFE membranes. Threads sometimes use fluorocarbons as lubricants, but ours don't.
1.8	What aren't you measuring?	We've tried to be as accurate and broad as possible, capturing as much data as we can, all the way down to the zip puller and care label. However there are some elements that we do not have weights for, so can't yet include: glue and adhesives (excluding seam tapes), threads – used to stitch the final product together, embroidery, heat transfers and screen prints and box wall mesh. Packaging is out of scope.

2. MATERIAL FACTS GENERAL P1

2.1	Will you keep Material Facts exclusively to yourselves?	Material Facts is NOT a branded programme. We are sharing our knowledge with industry groups and partners. Material Facts will support retailers when talking to their customers about sustainability credentials.
2.2	Are you the first brand in the outdoor industry to take such an approach?	We have seen this approach in other industries, e.g. food industry. To our knowledge, this kind of granular information has not been shared with end consumers by the outdoor industry so far.
2.3	Do you see any negative effects in sales by taking an honest and open approach to sustainability claims?	We have seen strong support for our transparent and open approach to accurate sustainability data.
2.4	Are there any products or ranges you are particularly focusing on?	We began by applying Material Facts to insulation, committing to deliver the tables by the AW23 consumer launch. The teams have worked hard across all ranges, and we are delighted to share that all apparel up to and including SS24 will be covered by the Material Facts data tables by this launch date. Equipment and accessories will come online within the coming seasons.

2. MATERIAL FACTS GENERAL P2

2.5	How is Material Facts different from other approaches to sustainability communications?	Material Facts is about integrity and passion for data and detail. We cannot underplay the complexity that sustainability data is characterised by. It means different things to each individual. We want to provide information that allows the end consumer to take their own educated decision.
2.6	Does Material Facts also include packaging credentials?	For now, Material Facts is only focusing on the product. We have included some storage elements where relevant i.e. stuff sacks on apparel items.
2.7	Is Lowe Alpine also covered by Material Facts?	For now, Material Facts only covers our apparel ranges. Equipment and accessories will come online within the coming seasons.
2.8	Are stuff sacks and storage bags included?	We have included Material Facts data for stuff sacks on apparel items. These are included within the fabric/trims of the tables. For sleeping bags, these will be included at a later date, alongside storage sacks.
2.9	Why have you not included stuff sacks for sleeping bags?	Sleeping bags have both stuff sacks and storage bags. For now, we have concentrated on the product (the sleeping bag) Material Facts table. We are exploring the best way to share the Material Facts data for storage and stuff sacks for a future release.
2.10	How accurate is the Material Facts data table?	The Material Facts data has been calculated by component, by item and by weight. Each table has been manually checked by product and material experts and cross-checked with fabric and factory certificates. We have taken all reasonable steps to ensure accuracy. However it is possible that inadvertent errors and tolerances in data may occur.

3.0 FLUOROCARBONS

3.1	Why does Rab still use fluorocarbons (PFAS/PFCs)?	We have removed all long-chain (C9) fluorocarbons from our supply chain. However, some short-chain fluorocarbons (C6) are still needed for some of our high-end technical products. We are working with our partners to eliminate fluorocarbons from all our ranges by AW24.
3.2	Why do zips and trims contain fluorocarbons (PFAS/PFCs)?	<p>Fluorocarbons are commonly used in the manufacturing process for many moulded items such as toggles and zips, as a release agent from moulds. Trace fluorocarbons may remain on the trim.</p> <p>Shell jackets include trims such as seam tapes and pocket liners that may contain ePTFE membranes.</p> <p>Threads sometimes use fluorocarbons as lubricants, but ours don't.</p> <p>Waterproof zips may also use DWR treatments that contain fluorocarbons, but we're working with our zips supplier to phase these out.</p> <p>Fluorocarbons can also be found in zip sliders.</p>
3.3	Why do some of your zips contain fluorocarbons?	<p>Although they might seem simple, zips are made of multiple components:</p> <p>Teeth – the interlinking elements that form a chain.</p> <p>Tape – the fabric used to stitch the teeth into the product.</p> <p>Slider – the part that moves up and down to open/close the chain.</p> <p>Stopper – the components that stop the slider at the top and bottom.</p> <p>Pin box – the box at the bottom of separating zips that aligns the two zipper halves to close.</p> <p>Puller – the extra loop of cord that is added to make pulling the slider easier.</p> <p>Ahead of launching Material Facts, our zip supplier informed us that, apart from some waterproof zips that use a DWR, all the zip components were fluorocarbon-free. In July 2023, as a result of additional due diligence and testing, they notified us that they had discovered fluorocarbons (specifically PTFE a legally compliant fluorocarbon) in the enamel paint they use on sliders and some pin boxes. As a global zip manufacturer, this paint can be found in zips used across multiple industries and by numerous apparel brands. We are working with our supplier to address the issue and expect to be able to switch completely to fluorocarbon-free variants by winter 2024.</p> <p>The contents account for the small amounts of enamel paint used on the metal slider and pin box. The zipper teeth, tape, stoppers, and pullers do not use enamel paint. The chance of PTFE being released during use is low as enamel paint is designed to be stable and resistant to penetration.</p> <p>In August 2023 we updated and reissued the Material Facts data tables for all products to account for the PTFE found in these components. As these are phased out each Material Facts table will be updated accordingly.</p>
3.4	Can fluorocarbons be introduced 'accidentally'?	Fluorocarbons are found in a variety of household and commercial products. They are (or have been) commonly used in ski/surf wax, chain lubricants, sewing machine lubricants, spray-on stain repellents, firefighting foam and fast-food grease repellent wrappers. It may be possible for cross-contamination to occur within a complex supply chain, in retail outlets or in the general day-to-day use of an item. As a result, unintentional trace fluorocarbons could be found on products.

4. OTHER

4.1	This product also says it contains synthetic insulation, but I can't see it listed.	We may use synthetic insulation in cuffs, over the shoulder or in the neck baffle of a mostly down insulated product. The data for these synthetic elements is captured under "trims".
4.2	How is the Total Recycled Content calculated?	The Material Facts totals are calculated by taking the weight and recycled content of each individual component, and calculating that as a percentage of the overall weight. A heavier component will have a greater impact on the total recycled content. The percentage of recycled content of each component is verified using GRS certification or equivalent.
4.3	Why have you only calculated Materials Facts for size 10/M/Regular?	We have used an average size to keep the data tables simple and as these are the sample sizes used throughout our business.
4.4	Why does the country of manufacture on the table differ from the care label?	There are occasions where the manufacturing country may change at short notice. While we will always try to maintain this information, products from previous seasons may still be in the supply chain. The care label is always accurate.
